Remarks:

The file contains technical information submitted
after the application was filed and not included in this
specification

Note: Within nine months from the publication of the mention of the grant of the European patent, any person may give notice to the European Patent Office of opposition to the European patent granted. Notice of opposition shall be filed in a written reasoned statement. It shall not be deemed to have been filed until the opposition fee has been paid. (Art. 99(1) European Patent Convention).

Description

The present invention relates to piezoelectric ceramics which is applied to a piezoelectric device such as a ceramic oscillator, a ceramic filter or a ceramic discriminator, for example, and more particularly, it relates to piezoelectric ceramics which is applied to a surface mounted type piezoelectric component, to which heat resistance is required.

In general, piezoelectric ceramics which is mainly composed of lead titanate zirconate ($\text{Pb}(\text{Ti}_z\text{Zr}_{1-z})\text{O}_3$) is widely applied to a ceramic filter or the like. Further, there are proposed piezoelectric ceramics, to which small amounts of various additives are added for improving piezoelectric characteristics thereof.

In particular, piezoelectric ceramics which is applied to a ceramic piezoelectric filter having a flat group delay time (hereinafter referred to as GDT) characteristic and small phase distortion must have a small mechanical quality factor Q_m . As to such piezoelectric ceramics having a small mechanical quality factor Q_m , known is piezoelectric ceramics which is prepared by adding niobium oxide, antimony oxide or tantalum oxide to lead titanate zirconate ($\text{Pb}(\text{Ti}_z\text{Zr}_{1-z})\text{O}_3$), or that prepared by partially replacing Pb atoms of lead titanate zirconate with a rare earth element.

On the other hand, a material which is prepared by diffusing Mn in $\text{Pb}(\text{Zr}_{0.52}\text{Ti}_{0.48})\text{O}_3$ is reported as piezoelectric ceramics containing a small amount of component diffused therein (M. Takahashi and S. Takahashi; Japan, J. Appl. Phys. Vol. 9, No. 8, pp. 1006 (1979)).

However, the aforementioned conventional piezoelectric ceramics having a small mechanical quality factor Q_m is generally increased in piezoelectric constant d to be applied to an actuator, or mainly aimed at increasing an electro-mechanical coupling factor K for application to a broad-band filter. Thus, such piezoelectric ceramics generally has a low Curie temperature and insufficient heat resistance.

Some of the aforementioned conventional piezoelectric ceramics having small mechanical quality factors Q_m have a high Curie temperature. When the temperature is increased in a soldering step or the like, however, the electromechanical coupling factor K is reduced to cause extreme displacement of resonance and antiresonance frequencies if electrodes provided across the piezoelectric ceramics are not short-circuited but opened.

When such a conventional piezoelectric ceramics having a small mechanical quality factor Q_m is applied to a surface mounted type filter element, therefore, the filter characteristics are extremely deteriorated upon exposure to a high temperature of about 250°C in a reflow soldering step.

Further, the aforementioned material prepared by diffusing Mn in $\text{Pb}(\text{Zr}_{0.52}\text{Ti}_{0.48})\text{O}_3$ is unsuitable for a filter element, due to high temperature dependence of resonance and antiresonance frequencies.

EP-A-0 012 583 discloses a piezoelectric ceramics composed of lead titanate zirconate and including MnO_2 , wherein up to 10 atomic-% of Pb maybe replaced by at least one of Sr, Ca and Ba. For preparing said ceramics, the raw materials including MnO_2 are all wet-mixed, filtered, dried and then calcined, so that the Mn component is homogeneously distributed through the ceramic material.

GB-A-2 028 791 discloses a process for preparing a piezoelectric ceramics composed of lead titanate zirconate and including MnO_2 , wherein all the raw materials including MnO_2 are wet-mixed, filtered, dried and then calcined, so that again the Mn component is homogeneously distributed through the ceramic material.

JP-A-62 298 192 discloses a piezoelectric ceramics composed of lead titanate zirconate, wherein part of the Pb atoms are substituted by Ca, Sr and/or Ba. The ceramics further includes 0.3-3.0 wt.-% Sb_2O_3 and 0.05-1.0 wt.-% of MnO_2 .

In order to overcome the aforementioned disadvantages, an object of the present invention is to provide piezoelectric ceramics, which is provided not only with a small mechanical quality factor Q_m but with excellent heat resistance and which can be suitably employed for a filter element having a flat group delay time characteristic and small phase distortion to be applicable to surface mounting.

To achieve the above object, the present invention provides a piezoelectric ceramics being expressed by $\text{PbZr}_{1-z}\text{Ti}_z\text{O}_3$, where $z = 0.45$ to 0.54 , 0.1 to 8 mole percent of said Pb atoms being replaced with at least one element selected from Ca, Sr and Ba,

said piezoelectric ceramics containing Mn in a range of 0.005 to 0.9 percent by weight of the whole in terms of MnO_2 , characterized in that said Mn exists in a grain boundary with higher concentration than that in the ceramic grains of said piezoelectric ceramics.

In the piezoelectric ceramics according to the present invention, 0.1 to 8 mole percent of the Pb atoms is replaced with at least one element selected from the group of Ca, Sr and Ba as described above, whereby the temperature coefficient of resonance frequency is reduced.

According to a specific aspect of the present invention, up to 5.0 mole percent of the $\text{PbZr}_{1-z}\text{Ti}_z\text{O}_3$ is further replaced with at least one element selected from La, Ce, Pr, Nd, Sm, Eu and Gd, whereby the mechanical quality factor Q_m is reduced.

According to another specific aspect of the present invention, at least one element selected from Sb, Nb, W and Ta is added to the piezoelectric ceramics in a range of up to 2.9 percent by weight of the overall piezoelectric ceramics in terms of Sb_2O_3 , Nb_2O_5 , WO_3 and/or Ta_2O_5 , whereby the mechanical quality factor Q_m is reduced.

In the piezoelectric ceramics according to the present invention, Mn is contained in the range of 0.005 to 0.9 percent by weight in terms of MnO_2 as described above, whereby the heat resistance is improved. This Mn is diffused to be contained in the piezoelectric ceramics after the same is fired. In other words, ceramics which is composed of the elements excluding Mn is fired so that Mn is thereafter diffused in the as-obtained sintered body, to be contained therein in the aforementioned specific range. Due to such diffusion, the Mn exists in the grain boundary with higher concentration than that in the grains of the piezoelectric ceramics.

According to the present invention, as hereinabove described, Mn is contained in the piezoelectric ceramics having a small mechanical quality factor Q_m and a high Curie temperature by diffusion to exist in the grain boundary with relatively higher concentration, whereby resistivity of the piezoelectric ceramics is reduced. Therefore, the piezoelectric ceramics is prevented from reduction in polarization as described later, so that changes of resonance and antiresonance frequencies can be reduced also when the piezoelectric ceramics is applied to a filter.

When polarized piezoelectric ceramics is heated and then cooled to the room temperature on standing, pyroelectric charges are generated in this piezoelectric ceramics. An electric field is applied by such pyroelectric charges in a direction opposite to that of polarization of the piezoelectric ceramics, to lower the degree of polarization.

According to the present invention, Mn is introduced into the piezoelectric ceramics, in order to quickly annihilate the pyroelectric charges and prevent reduction of the degree of polarization. Particularly when Mn is contained in the piezoelectric ceramics by diffusion at a temperature of 900 to 1100°C, for example, resistivity of the piezoelectric ceramics is reduced so that the pyroelectric charges are quickly discharged. Therefore, it is possible to effectively prevent the electric field, which is opposite to the direction of polarization, from application over a long time. Thus, it is possible to suppress reduction of polarization, so that changes of resonance and antiresonance frequencies can be reduced when the piezoelectric ceramics is applied to a filter element, for example.

When the piezoelectric ceramics according to the present invention is applied to a piezoelectric component, such as a piezoelectric filter, for example, which is surface-mounted by reflow soldering, it is consequently possible to reduce deterioration of characteristics caused by a high temperature of up to 250°C, particularly deviation in the passband of the filter and the reduction of the passband width, to sufficiently cope with surface mounting.

Due to the aforementioned specific composition according to the present invention, it is possible to obtain piezoelectric ceramics having a high electromechanical coupling factor K , small temperature changes of resonance and antiresonance frequencies, and a small mechanical quality factor Q_m (not more than 100, for example).

When the inventive piezoelectric ceramics is applied to a ceramic filter (piezoelectric filter) element, therefore, it is possible to attain excellent characteristics including a flat group delay time (GDT) characteristic and small phase distortion over a wide frequency band, thereby suppressing bit errors with respect to digital signals. Thus, the piezoelectric ceramics according to the present invention is particularly significant as a material for a piezoelectric filter element for digital signals.

The foregoing and other objects, features, aspects and advantages of the present invention will become more apparent from the following detailed description of the present invention when taken in conjunction with the accompanying drawings.

Fig. 1 illustrates an energy dispersive X-ray spectrum of grains in a sample No. 2 of piezoelectric ceramics according to Example 1 of the present invention;

Fig. 2 illustrates an energy dispersive X-ray spectrum of grain boundary in the sample No. 2 of the piezoelectric ceramics according to Example 1 of the present invention;

Fig. 3 illustrates an energy dispersive X-ray spectrum of grains in a sample No. 22 of piezoelectric ceramics according to Example 2 of the present invention; and

Fig. 4 illustrates an energy dispersive X-ray spectrum of grain boundary in the sample No. 22 of the piezoelectric ceramics according to Example 2 of the present invention.

Unlimited Examples of the present invention are now described, to clarify the present invention.

Example 1

Respective raw materials of PbO , SrCO_3 , La_2O_3 , CeO_2 , Pr_2O_3 , Nd_2O_3 , Sm_2O_3 , Eu_2O_3 , Gd_2O_3 , TiO_2 and ZrO_2 for forming piezoelectric ceramics were weighed out to attain compositions shown in Table 1, and wet-blended in a ball mill. The mixtures obtained by such wet blending were dried and thereafter calcined at 800 to 900°C for 2 hours. The calcined materials were wet-ground in a ball mill, to obtain mixed powder materials.

Caking additives such as water or polyvinyl alcohol were added to the mixed powder materials, which in turn were press-molded and thereafter fired at a temperature of 1150 to 1250°C for 2 hours, to obtain discoidal samples of ceramics having diameters of 10 mm and thicknesses of 1 mm. These samples were coated with the mixture of MnCO_3 powder and varnish, and then dried. Thereafter the samples were heated at a temperature of 900 to 1100°C for 2

hours, to be subjected to diffusion. Thereafter the samples were polished into thicknesses of 0.5 mm, and silver electrodes were applied at both ends of the samples. Thereafter the samples were polarized in insulating oil of 80°C for 30 minutes with an electric field of 2 to 3 kV/mm, to obtain samples of piezoelectric ceramics (vibrator samples). For the purpose of comparison, samples of piezoelectric ceramics (vibrator samples) were prepared in a similar manner to the above, in ranges which were out of the scope of the present invention.

As to these samples, specific resistance values ρ , electromechanical coupling factors K_p and mechanical quality factors Q_{mp} in radial vibration, and temperature coefficients (expressed as Fr-TC) of resonance frequencies F_r at temperatures of -20°C to 80°C.

Further, these vibrator samples were introduced into a thermostat of 250°C for 3 minutes to be subjected to heat treatment, extracted from the thermostat with electrodes applied at both ends of the samples being in open states, and thereafter allowed to stand for about 1 hour. Then, changes ΔF_r and ΔF_a of resonance and antiresonance frequencies F_r and F_a were measured.

Table 1 shows the results of the as-measured characteristics, i.e., specific resistance values ρ , electromechanical coupling factors K_p , mechanical quality factors Q_{mp} , temperature coefficients (Fr-TC) of resonance frequencies F_r , and changes ΔF_r and ΔF_a of the resonance and antiresonance frequencies F_r and F_a , of the respective samples.

Referring to Table 1, symbols \underline{A} , \underline{x} , \underline{B} , \underline{y} , \underline{z} and α represent respective components and rates of addition thereof in the following formula:

Namely, \underline{A} represents the types of the elements (at least one of Ba, Sr and Ca) substituting for Pb, and \underline{x} represents rates (mole percent) thereof. On the other hand, \underline{B} represents the types of the elements (at least one of La, Ce, Pr, Nd, Sm, Eu and Gd) substituting for Pb, and \underline{y} represents rates (mole percent) thereof. Further, \underline{z} represents rates (mole percent) of Ti, and α represents contents (percent by weight) of MnO_2 in the samples of piezoelectric ceramics.

Referring to Table 1, asterisks (*) show comparative samples of piezoelectric ceramics, which were out of the scope of the present invention.

It has been recognized from the results of measurement of the respective samples shown in Table 1 and other samples (not shown in Table 1) that the temperature coefficients Fr-Tc of the resonance frequency F_r were disadvantageously increased when the amounts of replacement with \underline{A} (Sr, Ba and/or Ca) were less than 0.1 mole percent, while the Curie temperatures were reduced and the changes ΔF_r and ΔF_a of the resonance and antiresonance frequencies F_r and F_a after heating were increased to deteriorate heat resistance, when the amounts of replacement with \underline{A} (Sr, Ba and/or Ca) exceeded 8 mole percent in total.

It has also been recognized that the Curie temperatures were reduced to deteriorate heat resistance when the amounts \underline{y} exceeded 5.0 mole percent.

It has further been recognized that the electromechanical coupling factors K_p were reduced when the rates \underline{z} of Ti exceeded 54 mole percent, while the Curie temperatures were reduced to deteriorate heat resistance when the rates \underline{z} were less than 45 mole percent.

Comparing an inventive sample (e.g., the sample No. 2) with the comparative sample No. 1 which was out of the scope of the present invention, it is understood from Table 1 that the specific resistance (resistivity) ρ of the sample No. 2 according to Example 1 of the present invention was smaller by at least 1 figure than that of the comparative sample No. 1 containing no Mn.

As to the inventive sample No. 2, elements existing in grains and grain boundary were analyzed with an analytical electron microscope. Figs. 1 and 2 illustrate the energy dispersive X-ray spectra of grain and grain boundary.

It is understood from Figs. 1 and 2 that Mn which was introduced into the sample No. 2 by diffusion was distributed in the grain boundary with higher concentration than that in the grain of the piezoelectric ceramics. In other words, it is understood that the specific resistance (resistivity) ρ of this piezoelectric ceramics was reduced due to such uneven distribution of Mn in the grain boundary of the piezoelectric ceramics.

It is also understood that the changes ΔF_r and ΔF_a of the resonance and antiresonance frequencies F_r and F_a after heating were extremely reduced as the result of such reduction of the specific resistance ρ , as shown in Table 1. Further, the mechanical quality factor Q_{mp} of the sample No. 2 was substantially identical to that of the sample No. 1 containing no Mn, while its electromechanical coupling factor K_p was considerably larger than that of the sample No. 1. Thus, it is understood that the characteristics of the sample No. 2 were improved also in these points.

When the amount of Mn is less than 0.005 percent by weight in terms of MnO_2 , sufficient effects cannot be attained as to improvement of the characteristics such as the specific resistance (resistivity) ρ and the frequency changes ΔF_r and ΔF_a , while the mechanical quality factor Q_{mp} and the frequency changes ΔF_r and ΔF_a are disadvantageously increased when the amount of Mn exceeds 0.9 percent by weight. Therefore, the amount of Mn is in a range of 0.005

to 0.9 percent by weight in terms of MnO_2 .

Example 2

Respective raw materials of PbO , SrCO_3 , TiO_2 , ZrO_2 , Sb_2O_3 , Nb_2O_5 , WO_3 and Ta_2O_5 for forming piezoelectric ceramics were weighed out to attain compositions shown in Table 2, and wet-blended in a ball mill. The as-obtained mixtures were subjected to steps absolutely identical to those of Example 1, to obtain vibrator samples of polarized piezoelectric ceramics. As to these samples, the respective characteristics, i.e., specific resistance values ρ , electro-mechanical coupling factors K_p , mechanical quality factors Q_{mp} , temperature coefficients (Fr-TC) of resonance frequencies F_r and changes ΔF_r and ΔF_a of resonance and antiresonance frequencies F_r and F_a were measured similarly to Example 1. Table 2 shows the results.

Referring to Table 2, symbols \underline{A} , \underline{x} , \underline{B} , \underline{z} , α and β represent respective components and rates of addition thereof in the following formula (2) respectively:

Namely, \underline{A} represents types of the elements (at least one of Ca, Sr and Ba) substituting for Pb and \underline{x} represents rates (mole percent) thereof, while \underline{B} represents types of the additives (at least one of Sb_2O_3 , Nb_2O_5 , WO_3 and Ta_2O_5) and β represents rates (percent by weight) thereof. Further, \underline{z} represents rates (mole percent) of Ti, while α represents contents (percent by weight) of MnO_2 .

Referring to Table 2, asterisks (*) show comparative samples of piezoelectric ceramics, which were out of the scope of the present invention.

It has been recognized from the results of measurement of the respective samples shown in Table 2 and other samples (not shown in Table 2) that the temperature coefficients Fr-Tc were disadvantageously increased when the amounts of replacement with \underline{A} (Sr, Ba and/or Ca) were less than 0.1 mole percent, while the Curie temperatures were reduced and the changes ΔF_r and ΔF_a of the resonance and antiresonance frequencies F_r and F_a after heating were increased to deteriorate heat resistance, when the amounts of replacement with \underline{A} (Sr, Ba and/or Ca) exceeded 8 mole percent in total.

It has also been recognized that the Curie temperatures were reduced to deteriorate heat resistance when the amounts β of \underline{B} (Sb_2O_3 , Nb_2O_5 , WO_3 and/or Ta_2O_5) exceeded 2.9 mole percent.

It has further been recognized that the electromechanical coupling factors K_p were reduced when the rates \underline{z} of Ti exceeded 54 mole percent, while the Curie temperatures were reduced to deteriorate heat resistance when the rates \underline{z} were less than 45 mole percent.

Comparing an inventive sample (e.g., the sample No. 22) with the comparative sample No. 21 which was out of the scope of the present invention, it is understood from Table 2 that the specific resistance (resistivity) ρ of the sample No. 22 according to Example 2 of the present invention was smaller by at least 1 figure than that of the comparative sample No. 21 containing no Mn.

As to the inventive sample No. 22, elements existing in grains and grain boundary were analyzed with an analytical electron microscope. Figs. 3 and 4 illustrate the energy dispersive X-ray spectra of grains and grain boundary.

It is understood from Figs. 3 and 4 that Mn which was introduced into the sample No. 22 by diffusion was distributed in the grain boundary with higher concentration than that in the grain of the piezoelectric ceramics. In other words, it is understood that the specific resistance (resistivity) ρ of this piezoelectric ceramics was reduced due to such uneven distribution of Mn in the grain boundary of the piezoelectric ceramics.

It is also understood that the changes ΔF_r and ΔF_a of the resonance and antiresonance frequencies F_r and F_a after heating were extremely reduced as the result of such reduction of the specific resistance ρ , as shown in Table 2. Further, the mechanical quality factor Q_{mp} of the sample No. 22 was substantially identical to that of the sample No. 21 containing no Mn, while its electromechanical coupling factor K_p was considerably larger than that of the sample No. 21. Thus, it is understood that the characteristics of the sample No. 22 were improved also in these points.

When the amount of Mn is less than 0.005 percent by weight in terms of MnO_2 , sufficient effects cannot be attained as to improvement of the characteristics such as the specific resistance (resistivity) ρ and the frequency changes ΔF_r and ΔF_a , while the mechanical quality factor Q_{mp} and the frequency changes ΔF_r and ΔF_a are disadvantageously increased when the amount exceeds 0.9 percent by weight. Therefore, the amount of Mn is in a range of 0.005 to 0.9 percent by weight in terms of MnO_2 .

Claims

1. Piezoelectric ceramics being expressed by $\text{PbZr}_{1-z}\text{Ti}_z\text{O}_3$, where $z = 0.45$ to 0.54 , 0.1 to 8 mole percent of said Pb atoms being replaced with at least one element selected from Ca, Sr and Ba,
said piezoelectric ceramics containing Mn in a range of 0.005 to 0.9 percent by weight of the whole in terms of MnO_2 , characterized in that said Mn exists in a grain boundary with higher concentration than that in the ceramic grains of said piezoelectric ceramics.
2. Piezoelectric ceramics in accordance with claim 1, wherein further up to 5.0 mole percent of said Pb atoms is replaced with at least one element selected from La, Ce, Pr, Nd, Sm, Eu and Gd.
3. Piezoelectric ceramics in accordance with claim 1, wherein at least one element selected from Sb, Nb, W and Ta is contained in a range of up to 2.9 percent by weight in terms of Sb_2O_3 , Nb_2O_5 , WO_3 and/or Ta_2O_5 .

Patentansprüche

1. Piezoelektrische Keramik, wiedergegeben durch $\text{PbZr}_{1-z}\text{Ti}_z\text{O}_3$, worin $z = 0,45$ bis $0,54$, wobei $0,1$ bis 8 Mol-% der Pb-Atome durch mindestens ein aus Ca, Sr und Ba gewähltes Element ersetzt sind,
wobei die piezoelektrische Keramik Mn in einem Bereich von $0,005$ bis $0,9$ Gew.-% des gesamten, angegebenen als MnO_2 , enthält, dadurch gekennzeichnet, daß das Mn in einer Korngrenze mit höherer Konzentration vorliegt als in den Keramikkörnern der piezoelektrischen Keramik.
2. Piezoelektrische Keramik nach Anspruch 1, wobei weiterhin bis zu $5,0$ Mol-% der Pb-Atome durch mindestens ein aus La, Ce, Pr, Nd, Sm, Eu und Gd gewähltes Element ersetzt sind.
3. Piezoelektrische Keramik nach Anspruch 1, wobei mindestens ein aus Sb, Nb, W und Ta gewähltes Element in einem Bereich bis zu $2,9$ Gew.-% als Sb_2O_3 , Nb_2O_5 , WO_3 und/oder Ta_2O_5 enthalten ist.

Revendications

1. Céramique piézoélectrique exprimée par $\text{PbZr}_{1-z}\text{Ti}_z\text{O}_3$, où z est compris entre $0,45$ et $0,54$, une quantité comprise entre $0,1$ et 8 mol % desdits atomes de Pb étant remplacée par au moins un élément choisi parmi Ca, Sr et Ba, ladite céramique piézoélectrique contenant Mn dans un intervalle de $0,005$ à $0,9$ %, en poids, de la totalité, en termes de MnO_2 , caractérisée en ce que ledit Mn existe dans la frontière de grain à une concentration supérieure à ce qu'elle est dans les grains de céramique de ladite céramique piézoélectrique.
2. Céramique piézoélectrique selon la revendication 1, où une quantité supplémentaire pouvant aller jusqu'à $5,0$ mol % desdits atomes de Pb est remplacée par au moins un élément choisi parmi La, Ce, Pr, Nd, Sm, Eu et Gd.
3. Céramique piézoélectrique selon la revendication 1, où au moins un élément choisi parmi Sb, Nb, W et Ta est contenu dans un intervalle pouvant aller jusqu'à $2,9$ %, en poids, en termes de Sb_2O_3 , Nb_2O_5 , WO_3 et, ou bien, Ta_2O_5 .
